## Parcial Automatización de Procesos Prof. Jose Antonio Tumalán Berja Est. Harold David León Hurtado 45161031

x=t[]

YEAT

 $\chi = \chi 1 + \left(\frac{\chi_2 - \chi_1}{\gamma_2 - \gamma_1}\right) (\gamma - \gamma_1)$ 

$$dy = 60$$

$$(70)(0.25)+0=2.5$$

$$d425 = 180 + \left(\frac{240 - 180}{3.9 - 2.2}\right)(2.5 - 2.2)$$

$$|\overline{d_{425}} = 190.58823531 \approx d_{425} = 190.5882$$

dy75

$$(10)(0.75)+0=7.5$$

$$dy75 = 420 + \left(\frac{720 - 420}{9.2 - 7.7}\right)(7.5 - 7.7)$$

- Modelo primer orden más trempo muerto

$$kp = \frac{34}{4u} = \frac{19}{60} \approx 0.1667$$

$$t90 = 0.9702(477.1429 - 190.5882) \approx 269.8220$$

$$6p1 = Kp \left(\frac{-t_{m}s}{\tau s+1}\right)$$
  $6p1 = 0.1667 \left(\frac{115.5709 s}{260.62205+1}\right)$ 

-Función de transferencia;

6) Sintentzar controlador para el proceso

$$K_{c} = \frac{1.2(240)}{(15p)(tm)}$$
  $T_{i} = 2(tm)$   $T_{d} = 0.5(tm)$ 

$$T_7 = 2(715.5109)$$
  $T_d = 0.5(715.5709)$ 

$$|KC = 16.2575|$$
  $|T_1 = 231.0278|$   $|Td = 52.7555|$ 

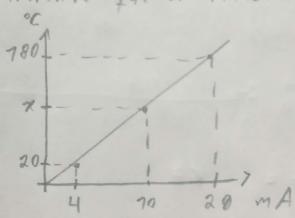

-PID Ziegler y Nichols

$$PID = 16.2575 \left( \left( 1 + \frac{1}{231.02785} \right) + \frac{57.75555}{1 + 269.82205} \right)$$

$$E_{p} = \frac{1}{7 + K_{p}} \qquad K_{p} = \lim_{5 \to 70} \frac{6(5)}{5 - 70} = \lim_{5 \to 70} \frac{-0.16675 + 0.02866}{260.85^{2} + 5.5765 + 0.077}$$

$$|E_p = \frac{1}{7+1.667} = 0.375|$$

a.) Partiendo que el transmisor es proporcional

Ecuquion de la recta: Y=mx+b

$$m = \frac{180 - 20}{20 - 4} = 10$$

Punto de Intercepto

Calculo para 10 mA
